In AutoCAD, the designer draws a series of lines, curves, circles, and other geometric shapes. As the designer adds each new geometric shape, the new shape automatically becomes part of a drawing. The designer can then move, rotate, and resize the new geometric shape. In this video tutorial, I will show you how to Draw Rectangles in AutoCAD using polylines. I will draw a rectangle with a 45 degree angle. To begin, open AutoCAD, and set the Scrap Dimensions to 1 and the Drafting Dimension to 0. The first step is to draw a line and name it the Layer Line. I will start with a white line, by pressing the [D] key. [D] Note: The Layer Line is the first line in the drawing. I will now draw a polyline that will be the top of the rectangle. To draw a polyline, we will first draw a rectangle. With the current setting, AutoCAD will simply put the rectangle on the Layer Line. But we want to draw the rectangle with a 45 degree angle. [C]> Now we will draw a polyline that will be the top of the rectangle. [C]> Since the Layer Line is on the bottom of the polyline, we will place the rectangle above the Layer Line. [D]> With the corner of the polyline now on the Layer Line, we can change the width of the polyline to 0.4. This will give us a rectangle that is half the size
