LISP LISP scripting is the native scripting language of AutoCAD. The object-oriented LISP (listing-oriented programming) scripting language offers a variety of tools and commands. The LISP programming language has a rich set of built-in commands and modules, which can be easily combined and extended by users through the use of a macro function library and the

Autodesk Scripting API. AutoCAD 2016 supports both script-based macros and object-oriented LISP. LISP syntax and general rules: LISP modules and autoloader: Example LISP (defun loadpath () "Returns path of the current drawing (a string)") (defun main () (print loadpath)) Run from within the AutoCAD program. AutoCAD LISP programming is very similar to Visual LISP, but AutoCAD offers: A richer API, supporting object-

oriented programming. A rich array of native objects that can be extended with LISP modules. Different Autoloading features VBA AutoCAD supports VBA, Visual Basic for Applications, and also includes the Autodesk Scripting API to expose AutoCAD features and functionality to applications written in Visual Basic. NET The AutoCAD.NET object-oriented programming language used to develop add-ons for AutoCAD has

been discontinued. .NET was a development language designed by Microsoft for application development. .NET used the Common Language Runtime, a Microsoft-developed and -supported runtime environment which was open sourced and available for use by third parties. ObjectARX ObjectARX is a COM+ and .NET object model, a DLL based on the Component Object Model and the Common Object Request Broker Architecture. This was

initially developed for AutoCAD Architecture, and has since been incorporated into AutoCAD X and AutoCAD LT. See also AutoCAD List of CAD software List of AutoCAD-compatible ca3bfb1094

Create a new drawing. You can use the free Autocad drawing template. Change the drawing resolution to 50. Create a 3D view of the model. Make sure it is displayed on the screen and not minimized. Model You will model the 3D objects from the supplied STL (stereolithography) files. Open the 3D modelling software and load the STL file. Export to.dxf format. On

the model selection screen, you can select models to use. It is easier to change the selection while you are still in the model selection screen. Be sure that when you click apply changes, you have selected the correct model, and not the incorrect model. When you have all the objects selected, you can draw them. They appear as they do in the model preview window. Select the object, right click, then select extrude. This creates a solid shell from the

object. To change the depth of the shell, change the depth setting on the right side of the screen. If you make a mistake, select the entire object, and go to the Object Properties window. On the Drawing tab, select the Repair tool. The Repair tool will break the damaged object into separate parts. Go to tool menu and click on Repair. Select objects to repair, right click and click on repair. Click OK. This will show the repaired object. If

your object is still damaged, repeat this process until you have a repaired object. Export your drawing Go to File, then click on save. Give your drawing a name and save it.
