Measles, rubella, and mumps are highly infectious, vaccine-preventable, viral diseases which can have serious complications. They are particularly important in children, who are the primary targets for measles, mumps, and rubella vaccination. Although measles, mumps, and rubella vaccine were introduced in England in 1971, their use was not systematically promoted and uptake was not initially high. Currently in England the immunization coverage for these vaccines is close to 95%, with marked regional variation. In Germany, immunization coverage in a representative sample of the population has been estimated to be only around 90%. This study compared vaccination coverage with measles, mumps, and rubella vaccine between England and Germany in children and adults using data from nationally representative surveys in 1990 and 1995. The results indicated that coverage was similar in both countries for the children, but was significantly lower in Germany for the adults. Low vaccination coverage has already been reported for measles, mumps, and rubella vaccine in England and this study indicated af5dca3d97
