Many vehicles are today equipped with systems to provide driver assistance or safety functions. One such system is a speed warning system used to provide a driver with information regarding an accident that has occurred in a preceding vehicle and may result in a crash of a present vehicle. Such speed warning systems are known to be based on a distance from a preceding vehicle following a vehicle in which the systems is installed. It is also known that the distance, as well as the speed of the preceding vehicle, may be calculated from the speed of the present vehicle as well as the speed of the preceding vehicle. A disadvantage of the known systems is the fact that the information is not based on the speed of the vehicle that actually caused the accident. For example, it is known to provide speed warning systems that provide a driver with information regarding a preceding vehicle that may result in a crash of the present vehicle and whereby the speed of the preceding vehicle is greater than the speed of the present vehicle. What is needed is a speed warning system that provides information regarding a preceding vehicle that is both the cause of an accident of a present vehicle and the result of an accident of a preceding vehicle.Q: HtmlHelper Extension Method for Standard WebControls I'm currently migrating a fairly large site over to MVC 2 and I'm trying to figure out how to use some of the HtmlHelpers for the standard Web e79caf774b
