Roblox is an online game platform and game creation system developed by Roblox Corporation that allows users to program games and play games created by other users. Created by David Baszucki and Erik Cassel in 2004 and released in 2006, the platform hosts user-created games of multiple genres coded in the programming language Lua. For most of Roblox's history, it was relatively small, both as a platform and a company. Roblox began to grow rapidly in the second half of the 2010s, and this growth has been accelerated by the COVID-19 pandemic. As of November 2018, Roblox had 164.3 million monthly active users, including more than half of all American children under 16. Roblox hosts many different types of games, including virtual worlds, games, simulations, and social games, and offers many different modes of play to users. The most popular mode of play is a sandbox mode, which allows the user to interact with objects, buildings, and characters. Roblox is free to play, with in-game purchases available through a virtual currency called Robux. Please enter the code at the top of the page, but dont worry you will receive your free robux. Newtonsoft.Json.Serialization.JsonSerializerSettings The Newtonsoft.Json.Serialization.JsonSerializerSettings type is used to configure a serializer. For example, a JsonSerializerSettings object can be configured to use the UTF-8 byte order mark and to lower case the property names. The JsonSerializerSettings object can also be configured to use a different serializer for classes that implement the IConvertible interface than for other types. Finally, the JsonSerializerSettings object can be configured to use a different serializer for a specific member name. Use the.JsonPropertyAttribute to specify that the property should be serialized. Use the JsonConvert attribute to specify a custom converter. All of the methods on the JsonSerializerSettings class can be called statically, but they can also be called dynamically at run time. Get, set, and remove members are described in the following sections. For more information about configuring a serializer, see the MSDN documentation for the JsonSerializerSettings Class. Here you can access all of the settings available in a JsonSerializerSettings. The JsonSerializerSettings object is based on the TextReaderSettings and StringWriterSettings objects. Because the same settings can be specified for these types, the JsonSerializerSettings object has the same properties and methods. Use a JsonConvert to specify a custom converter for a member of a type. A converter is an object that converts objects from one type to another type. The converter must implement two methods: ConvertToString(objectvalue) ConvertFromString(stringvalue) The first method takes a value of one type and converts it to another type. The second method takes a value of another type and converts it to the first type. If the converter is a type converter, ConvertFromString(stringvalue) is never called, and ConvertToString(objectvalue) is not called for a null value. Otherwise, ConvertFromString(stringvalue) can be used to convert a null value to the first type, and ConvertToString(objectvalue) can be used to convert a null value to the second type.
